PROJECT GOAL

The goal of SmartMoney Intelligence

To create a connected financial management platform that helps SMEs, businesses, rental managers and property managers collect and reconcile money, control budgets, understand cash flow, identify financial opportunities and make better financial decisions from one trusted place.

The intended outcome: turn fragmented financial activity into one clear flow of information, insight and action.

PART 1 • FIVE PROBLEMS

Five problems businesses face.

Financial information is often scattered across payment channels, records and spreadsheets. This creates delays, uncertainty and missed opportunities.

SMARTMONEY INTELLIGENCE

01. Unpaid and delayed collections

Outstanding customers, tenants and invoices are difficult to prioritise and follow up consistently.

02. Poor visibility of cash and spending

Users may know their balance without knowing where money is going or what their future cash position looks like.

03. Manual reconciliation and fragmented records

Payments from different channels often require manual matching against invoices, customers or tenants.

04. Difficult financial decision making

Major decisions such as borrowing, spending or investing require a clearer picture of financial health.

05. Limited access to suitable financial opportunities

Eligible users may struggle to discover and initiate appropriate lending or investment opportunities.

PART 2 • FIVE CONNECTED SOLUTIONS

Five connected solutions.

The strength of **SmartMoney Intelligence** is that every major feature directly addresses a real financial problem.

PROBLEM 01

Collections Intelligence

Prioritise outstanding customers, track ageing and trigger payment reminders and follow up actions.

PROBLEM 02

Cash Flow and Budget Management

Track income, expenses, budgets and projected liquidity in one view.

PROBLEM 03

Unified Financial Reconciliation

Connect payment channels and business records, match transactions and flag exceptions.

PROBLEM 04

Financial Health and Decision Insights

Show financial health, credit readiness and scenario impact before a major decision.

PROBLEM 05

Financial Opportunity Hub

PART 3 • BUSINESS MODEL

How SmartMoney Intelligence makes money.

The platform can generate recurring SaaS revenue while creating additional income through financial partnerships and premium capabilities.

01. SaaS subscriptions

Monthly plans for SMEs, businesses, rental managers, property managers and larger organisations based on users, properties, transactions and features.

02. Financial partnership revenue

Earn agreed referral or partnership revenue when eligible customers successfully connect to authorised lending or investment products.

03. Premium financial tools

Charge for advanced cash flow forecasting, reporting, portfolio analytics, budgeting and decision support.

Offer institutions and businesses paid API access, white label capabilities, integrations and higher usage limits.

Enterprise APIs

PART 4 • WHY SMARTMONEY

Why would someone choose SmartMoney instead of spreadsheets, separate apps or manual processes?

The value is not just storing financial information. It is bringing the right information, payment actions and financial decisions together in one connected experience.

SMARTMONEY INTELLIGENCE

One place instead of many

Collections, budgets, expenses, reconciliation, cash flow and financial opportunities are brought together instead of being spread across spreadsheets and separate applications.

Less manual work

Payments can update records automatically, reconciliation can reduce repetitive matching and reminders can be triggered without constant follow up.

Action, not just reports

The platform moves beyond showing numbers by highlighting what needs attention and what action can be taken next.

Connected financial services

Payment APIs, banking partners, ERP data and future financial services can connect through one platform rather than separate integrations.

Built for different operations

SMEs, businesses, rental managers and property managers can use workflows designed around their financial operations.

Scales with the organisation

Start with financial management and expand into payments, financing, investments, property portfolios and integrations as needs grow.

Traceable and secure

Transactions and important actions can be tracked through audit trails, role based access and controlled integrations.

Measurable improvement

Users can track whether collections improve, budgets are controlled, liquidity becomes healthier and decisions become more informed.

PART 5 • BENEFICIARIES

One platform. Multiple financial use cases.

SMEs

Collections, budgets, cash flow, reconciliation,

Businesses

Revenue, expenses, receivables, liquidity,

Rental Managers

Rent collection, tenant balances, property budgets,

Property Managers

Multi property collections, expenses, reconciliation and

PART 6 • BUSINESS DASHBOARD

A dashboard that answers the important questions.

Instead of forcing a manager to interpret separate spreadsheets, statements and payment reports, SmartMoney brings operational and financial indicators into one view.

BUSINESS HEALTH

84 / 100

CREDIT READINESS

82 / 100

PART 7 • CORE WORKFLOW

From transaction to financial action.

The system is designed around a continuous financial workflow rather than isolated modules.

Transaction

Reconcile

Budget & Cash Flow

Financial Insight

Action

Updated Records

1. Capture

2. Reconcile

3. Understand

SMARTMONEY INTELLIGENCE

Receive payment, invoice, expense,
connected channels.

Match transactions against the relevant
invoice, customer, tenant, account or
obligation.

Update budgets, cash flow, receivables
and financial health indicators from the
reconciled data.

4. Act

Trigger a collection action, payment
request, budget response, financing
application or investment opportunity.

PART 8 • TECHNICAL FOUNDATION

Designed around APIs, not isolated screens.

Angular

Dashboard, reports, collections, insights, alerts and management
workflows.

Java + Spring Boot

REST APIs, authentication, business rules, reconciliation,
notifications and financial calculations.

SMARTMONEY INTELLIGENCE

Users, organisations, properties, invoices, transactions, budgets, metrics, alerts and audit records.

Integration Hub

Payment providers, ERP systems, REST APIs, webhooks, scheduled jobs, SMS and email services.

Mobile

Flutter for cross platform mobile delivery and Swift where native iOS capabilities are required.

Security Foundation

Authentication, role based access, encryption, tenant isolation, audit trails, secure secrets and controlled partner access.

ERP / Business Data

SmartMoney API

Payment Provider

Bank / Investment Partners

PART 9 • DATA INTEGRITY AND TRUST

People should know what happens to their financial data.

What data is collected?

Only information required to provide the selected services, such as business details, transaction records, invoices, budgets, account information and application details.

Why is it collected?

Data is used to process transactions, reconcile payments, provide financial insights, manage budgets, support approved services and improve platform reliability.

Who can access it?

Access is limited by role and business need. Staff, administrators and approved partners only see information required for authorised actions.

How is it protected?

Encryption in transit, secure authentication, role based access, tenant isolation, audit logs, secure secrets management, backups and controlled API access.

How is misuse prevented?

Sensitive actions are logged. Data should not be sold or reused for unrelated purposes without appropriate permission, lawful basis and transparent disclosure.

What happens when data is shared?

Payment providers, banks or authorised partners receive only the information necessary for the requested service through secured APIs and controlled agreements.

Can users stay in control?

Users should be able to review important account information, understand why information is needed and receive clear notices about how data is handled.

What builds trust?

Clear privacy policies, consent where required, audit trails, data retention controls, security reviews and defined data governance processes.

Trust principle: Use financial data to deliver the service the user expects, protect it from unauthorised access and make important data use accountable.

PART 10 • RISK AND LOSS MITIGATION

How SmartMoney helps prevent and reduce avoidable financial loss.

Financial institutions remain responsible for regulated payment and fraud controls. SmartMoney focuses on operational controls, visibility and recovery around the user's financial records.

Payment verification

Transaction limits

Real time alerts

SMARTMONEY INTELLIGENCE

Validate transaction references, status before records are updated or actions are confirmed.

Configure limits for payments, transfers, refunds and other high risk actions to reduce exposure from mistakes or compromised accounts.

Notify authorised users about failed payments, unusual account events, overdue collections, balance risks and other events that need attention.

Reconciliation controls

Automatically compare payment records against invoices and obligations, then flag unmatched or inconsistent records.

Audit trail and accountability

Record important user and system actions so issues can be traced, investigated and resolved without relying on manual memory.

Data backup and recovery

Maintain encrypted backups, recovery points and restoration procedures so financial records can be recovered after accidental deletion, system failure or data corruption.

Core principle: Prevent avoidable loss where possible, detect operational problems early and make recovery and investigation easier when an incident occurs.

SmartMoney Intelligence to thrive.

The project must prove the core financial journey while establishing a foundation that can grow into a production SaaS platform.

Secure financial foundation

Authentication, role based access, organisation and property profiles, financial records, secure data separation, audit trails and controlled permissions.

Payments, collections and reconciliation

Payment API or sandbox integration, callbacks, payment notifications, collections workflows and automatic matching against invoices, customers or tenants.

Budgets, cash flow and financial intelligence

Income and expense tracking, budget versus actuals, cash flow projections, financial health indicators, collection priorities and clear decision support.

Financial opportunities and partner integrations

Eligibility and readiness information for authorised lending, investment or asset financing opportunities, with partner

Testing, security and continuity

Realistic UAT scenarios, API security, error handling, monitoring, encrypted backups, data recovery and deployment practices that support a reliable SaaS product.

Practical success: a user can receive or enter financial data, collect a payment, reconcile it, update a budget and cash flow view, receive a useful insight and take an informed financial action from the same platform.

CLOSING PROPOSITION

What if a business could ask one system:

"Where is my money, what is happening to my cash flow, who should I collect from, how healthy is my business, and can I afford my next financial decision?"

SMARTMONEY INTELLIGENCE

turns financial data into action.
